Hipotesis:

Nuestra hipotesis es que nue nuestro algoritmo funcionara de manera parecida al FIFO por su similitude de funcionamiento. Nuestro algoritmo funciona en victimizar el marco el cual ultimo se uso. Nosotros pensamos que Habra una decrecimiento lineal en la cantidad de faltas de paginas al aumentar la cantidad de marcos.

Falta de paginas focus:

Random

FIFO Custom

Random

Falta de pagina scan:

FIFO Custom

Rand

Reading Focus:

Random

Analisis de Resultados:

Al analizar los resultados se aserta lo que pensabamos, nuestro algoritmo custom nos entrega un rendimiento parecido al de FIFO, expeto en los scans donde osbservamos una gran falla en nuestro algoritmo. Es interesante observer que si bien sigue el algoritm FIFO y el custom un decreciemiento lineal de falta de paginas como pensabamos, ocurre una caida bastante brusca al asercarse a los 100 marcos.

En base a los resultados entregados encontramos que el algoritmo rand es el optimo en la gran mayoria de los casos.
